# CS 126 Lecture A4: Sequential Circuits

#### Introduction

- An S-R Flip-flop
- More flip-flops
- Registers and register files
- Counters
- Conclusions

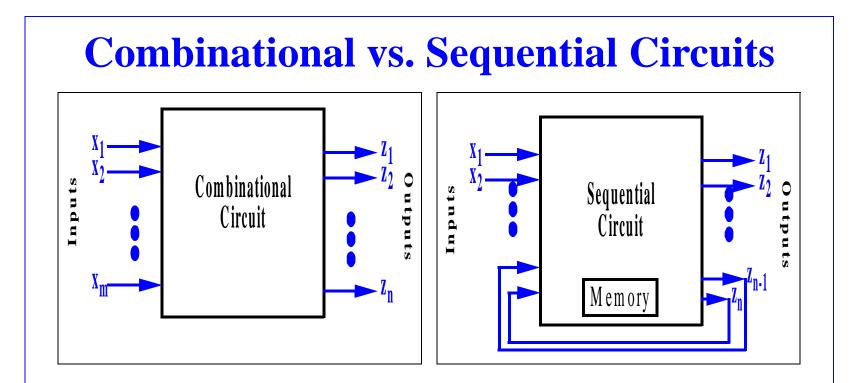

12-2

## Where We Are At

- We have learned the abstract <u>interface</u> presented by a machine: the instruction set architecture
- What we are learning: the **<u>implementation</u>** behind the interface:
  - Start with switching devices (such as transistors)
  - Build logic gates with transistors
  - Build combinational circuit (memory-less) devices using gates
  - <u>Today: build sequential circuit (memory) devices</u>
  - Thursday: glue these devices into a computer

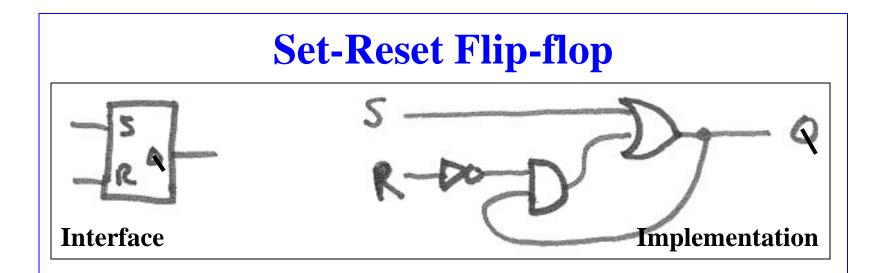

### Memory-less Devices vs. Devices with Memory

- What we we have learned in the last lecture
  - Devices that can carry out one step of operation
- What they can't do
  - "Remember" history of operations
  - Carry out a sequence of operations in which later operations depend on results of previous ones

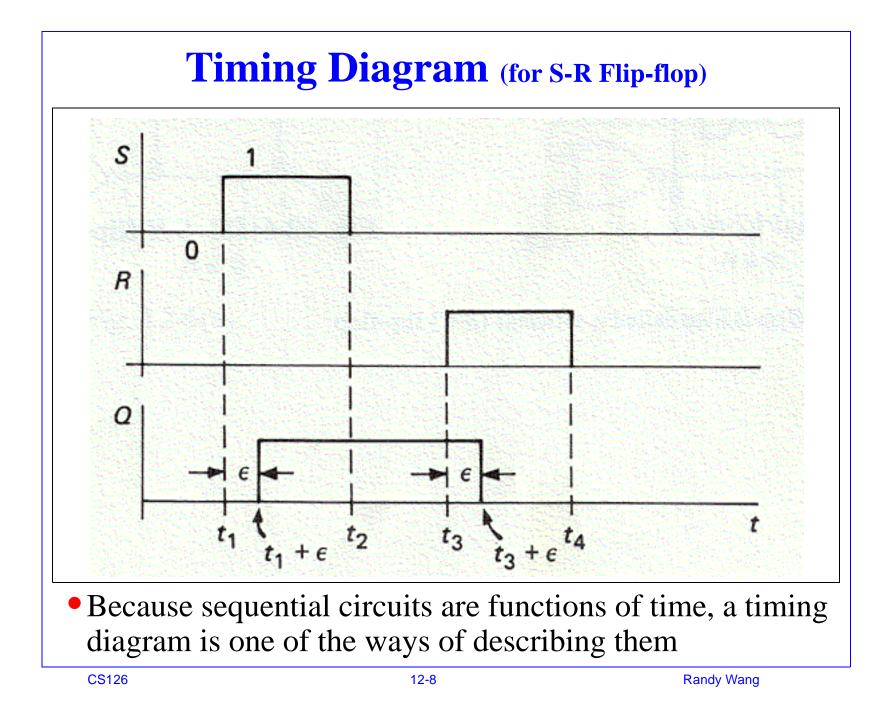

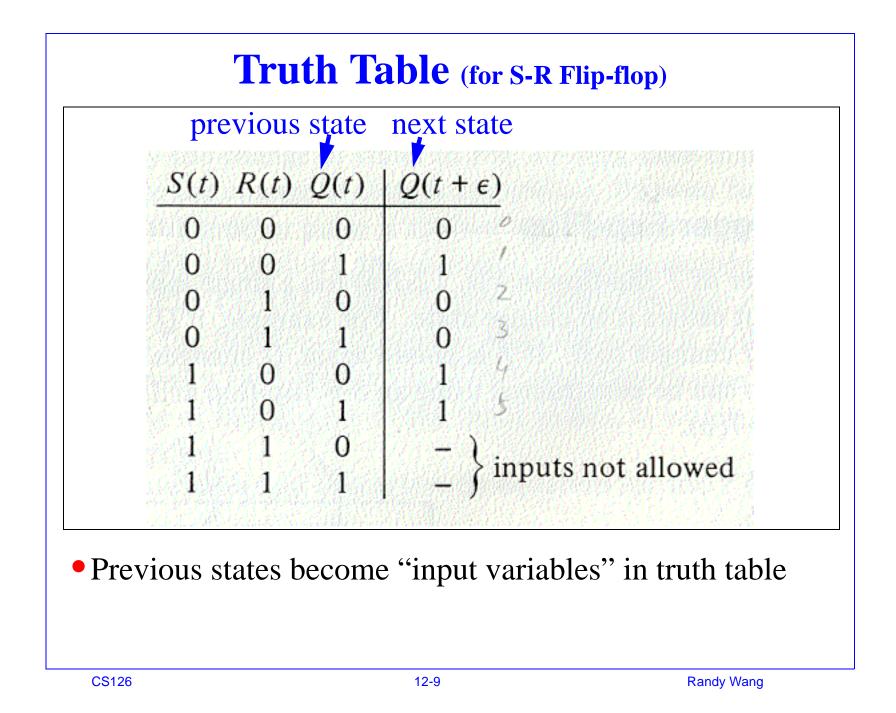

- Combinational circuits
  - Outputs determined solely by inputs
- Sequential Circuits
  - Characterized by feedbacks
  - Outputs determined by inputs and previous outputs

- Introduction
- <u>An S-R Flip-flop</u>
- More flip-flops
- Registers and register files
- Counters
- Conclusions

- A flip-flop
  - A smallest sequential circuit
  - Can "remember" a bit of information
- An S-R flip-flop
  - Pulse on Set (S) line turns flip-flop on
  - Pulse on Reset (R) line turns flip-flop off
  - If S=R=0, nothing happens
  - S=R=1 not allowed

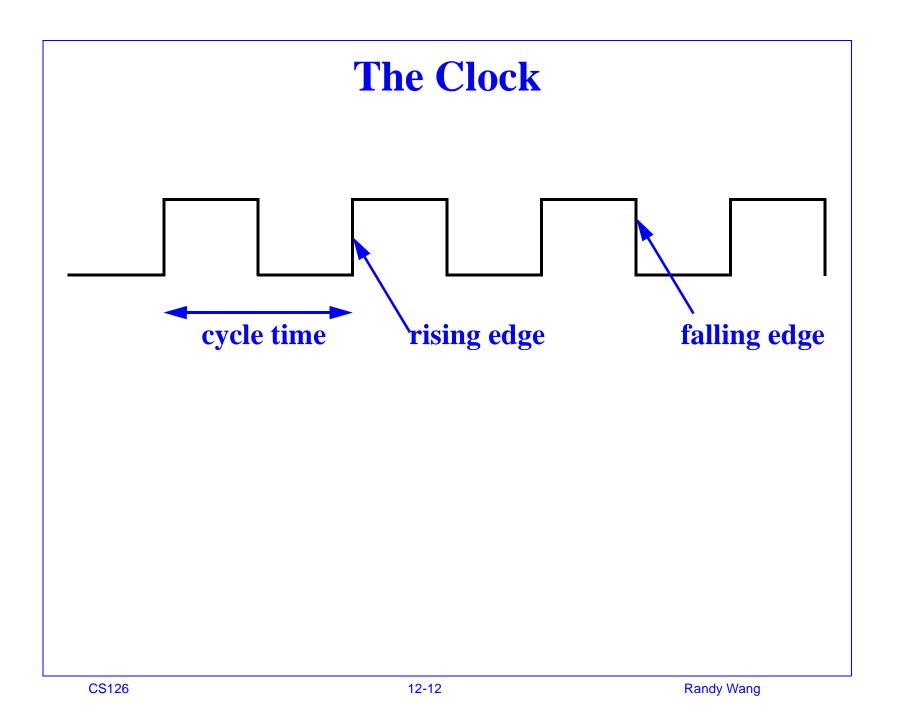

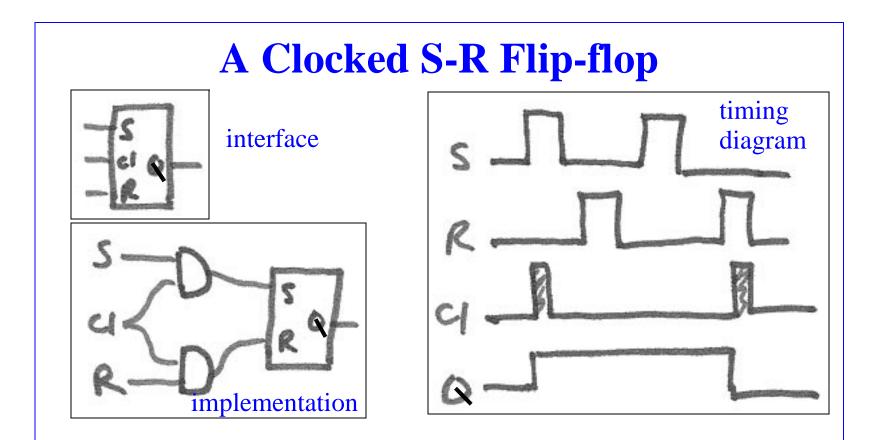

#### Characteristic Equation (for S-R Flip-flop)

$$Q^+ = S + R'Q$$
 (SR=0)

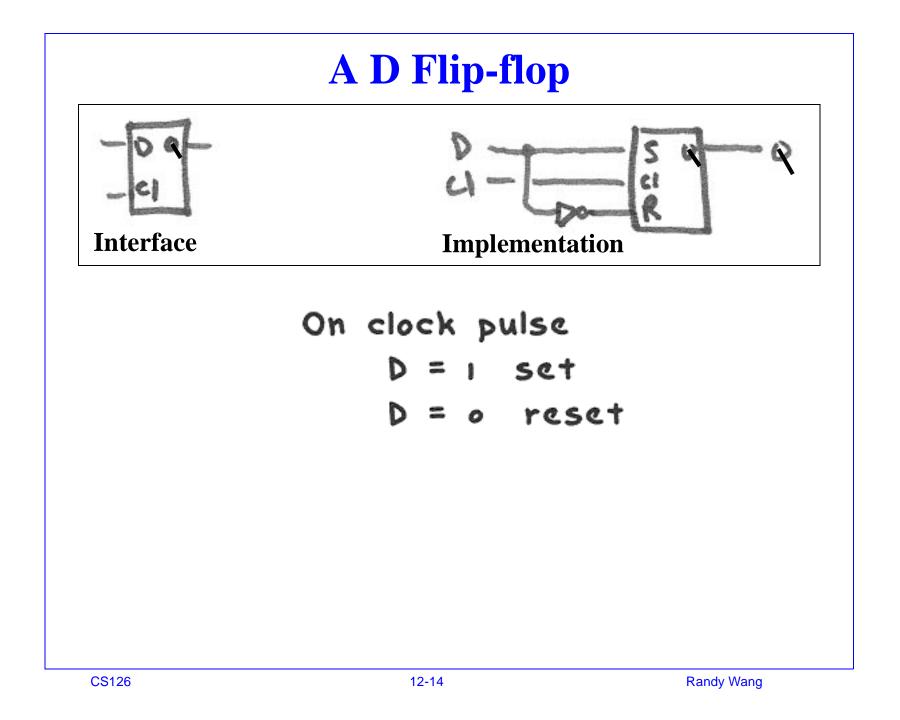

- An equation that expresses the next state of a flip-flop in terms of its present state and inputs (also called next state equations)
- Timing diagrams, truth tables, and next-state equations are important tools for understanding and constructing more sophisticated sequential circuits as well

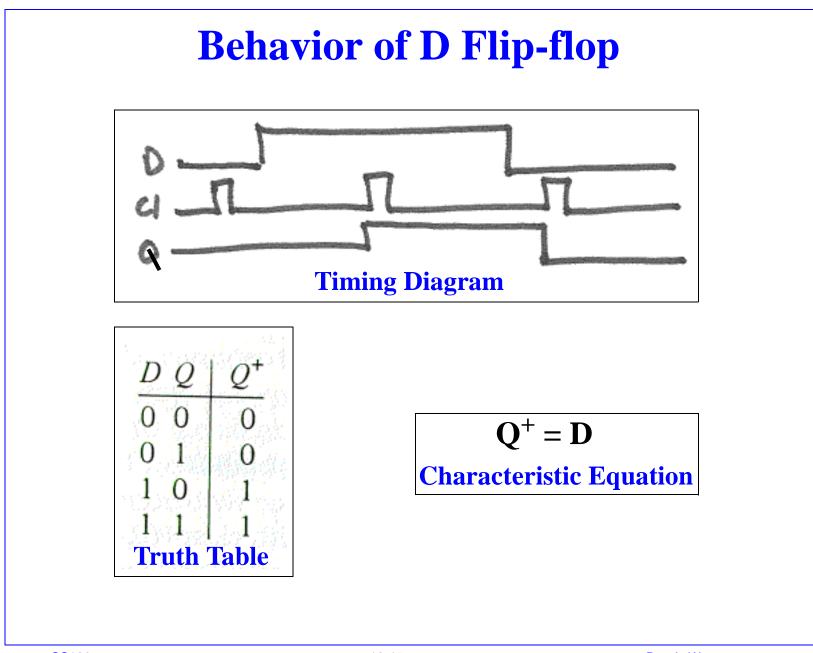

- Introduction
- An S-R Flip-flop
- <u>More flip-flops</u>
- Registers and memory
- Counters
- Conclusions

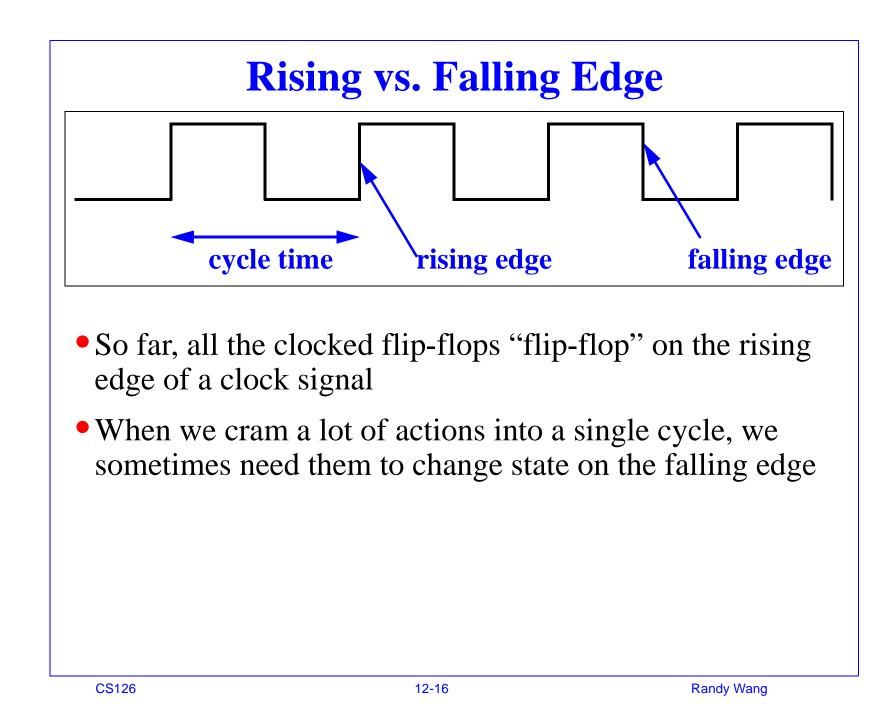

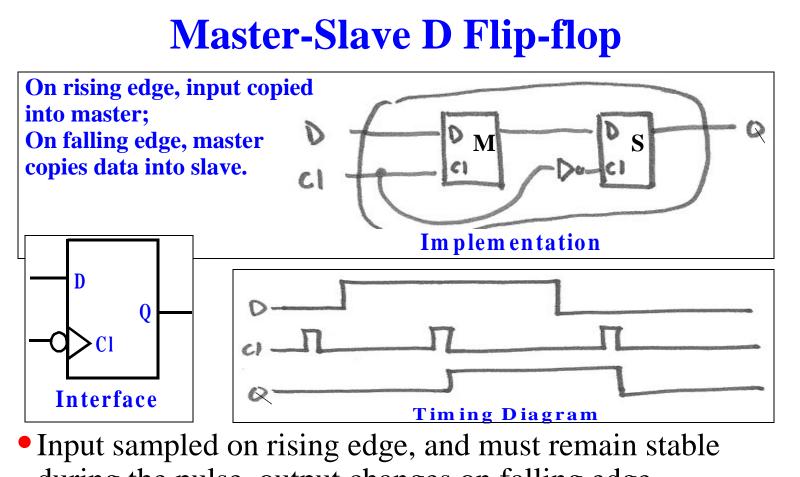

- In large sequential networks, there are many flip-flops
- Need to synchronize operations of different flip-flops
- Synchronization provided by a a common clock (pulse)

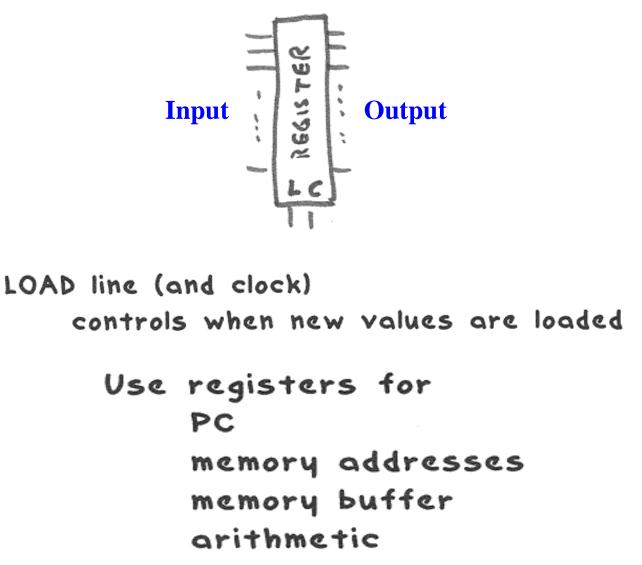

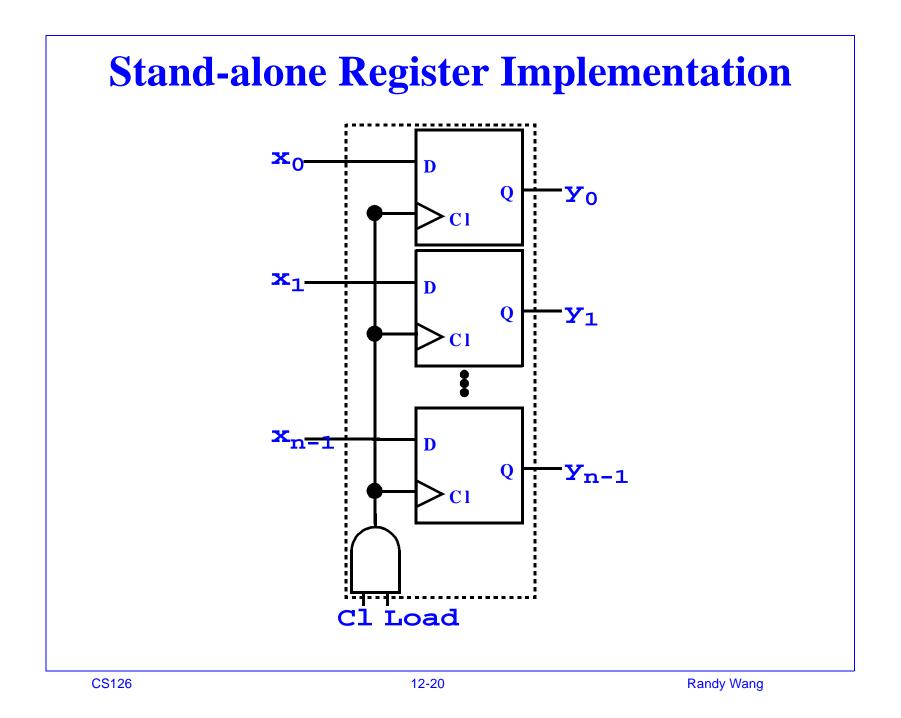

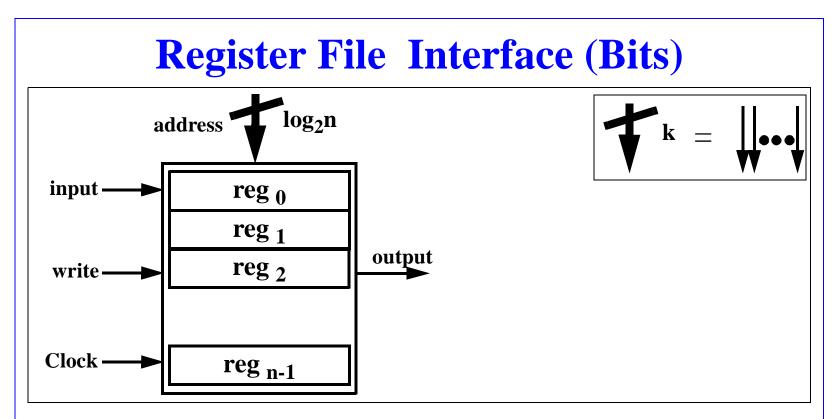

- during the pulse, output changes on falling edge
- Question: why don't we just invert the clock using a NOT?
- Another type: "edge-triggered", allows input change during clock pulse

- Introduction
- An S-R Flip-flop
- More flip-flops
- <u>Registers and register files</u>
- Counters
- Conclusions

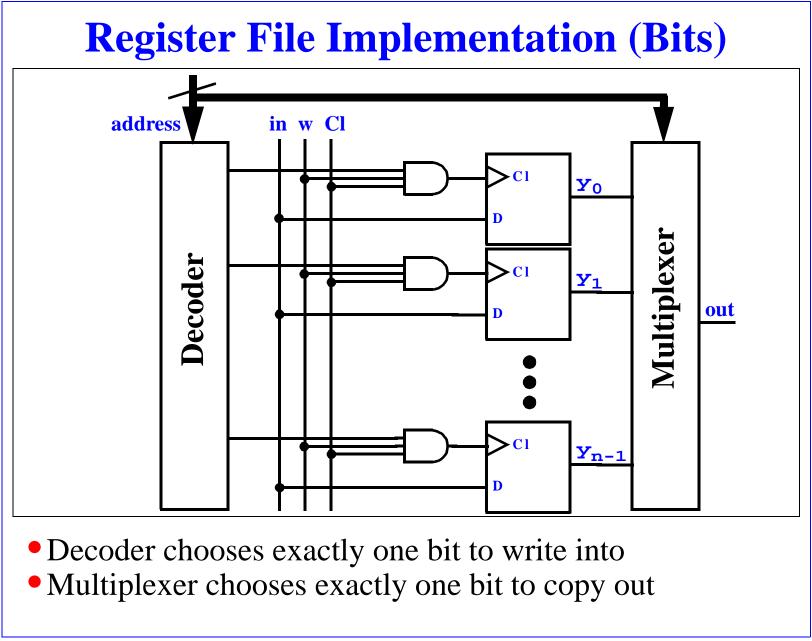

#### **Stand-alone Register Interface**

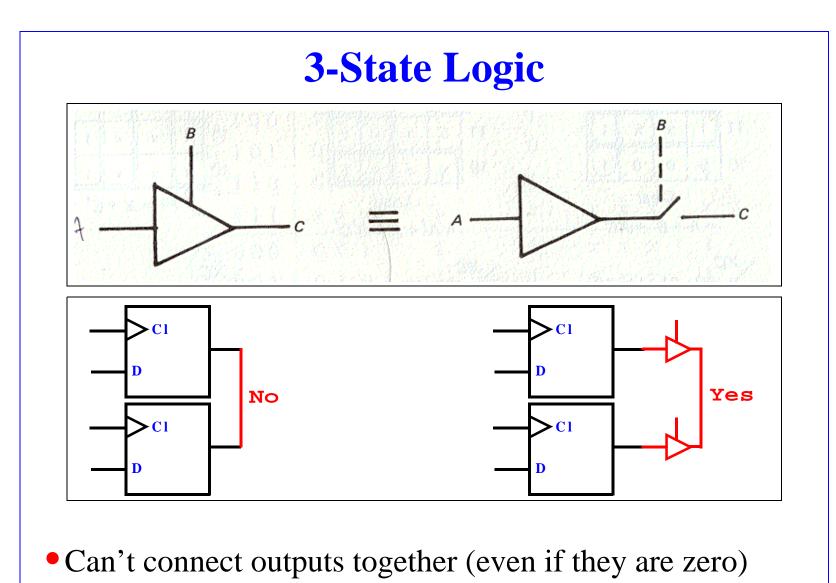

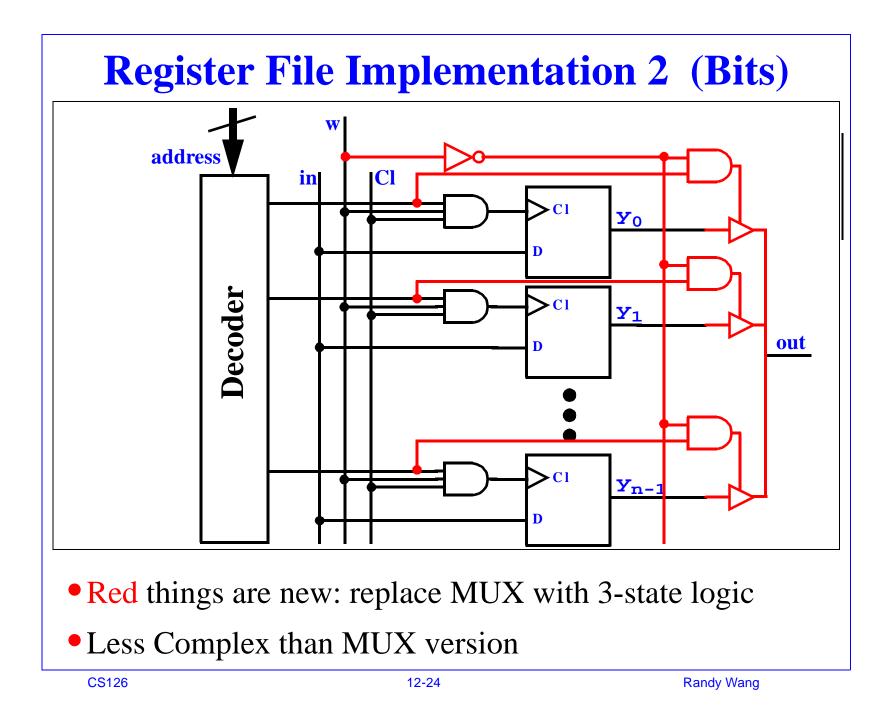

- bunch of bits to choose from
- "address" specifies which bit
- if "write" is 1, "input" gets copied into the chosen bit on clock pulse
- if "write" is 0, chosen bit appears on "output"

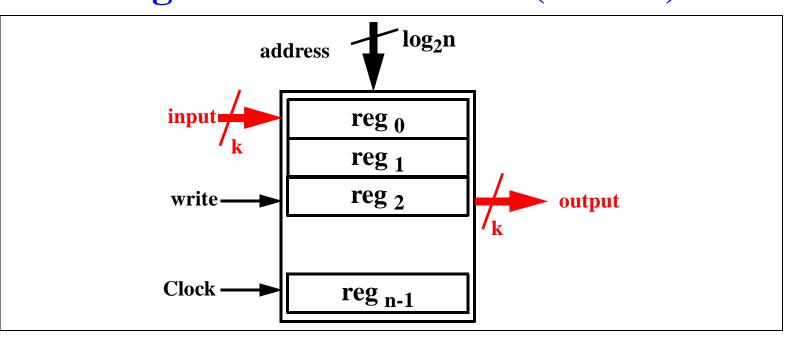

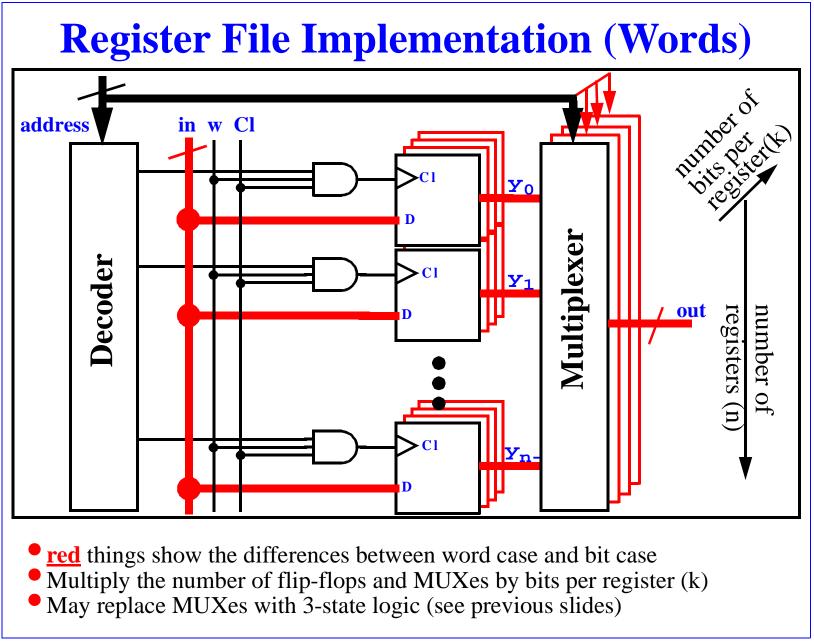

• Must use multiplexer (or its equivalent: [3-state logic])

#### **Register File Interface (Words)**

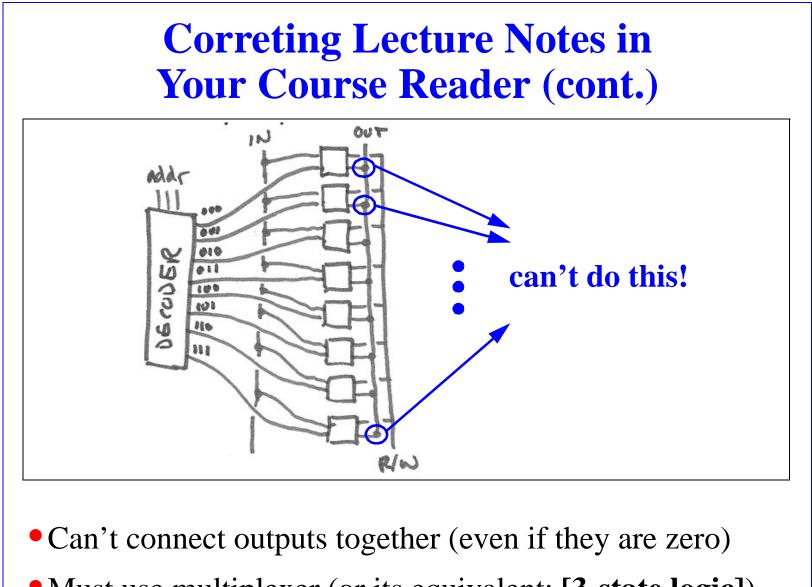

- Register file of k-bit words
- <u>red</u> things show the differences between word case and bit case

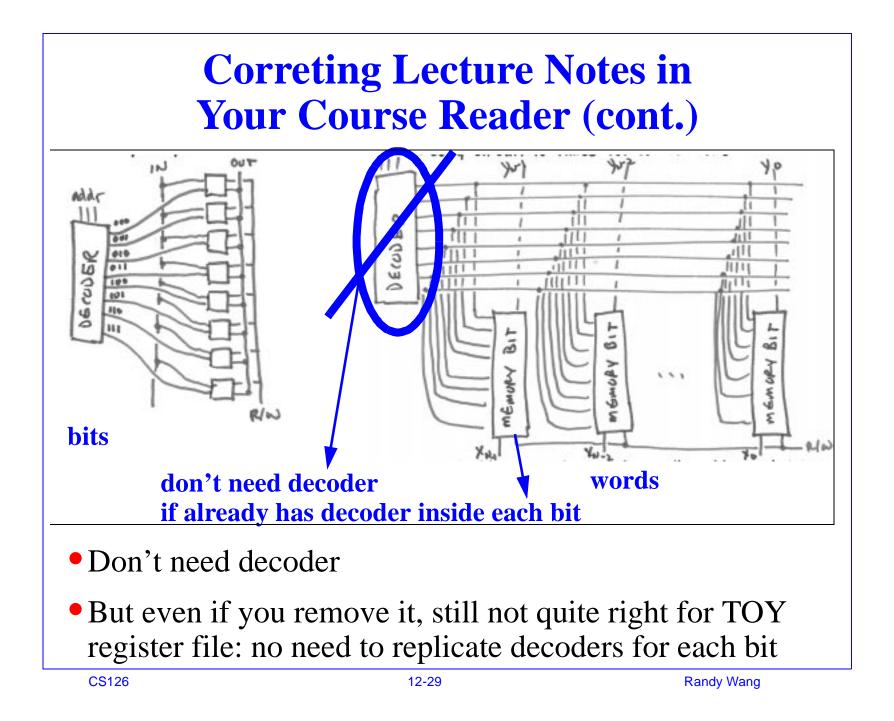

#### **Correting Lecture Notes in Your Course Reader**

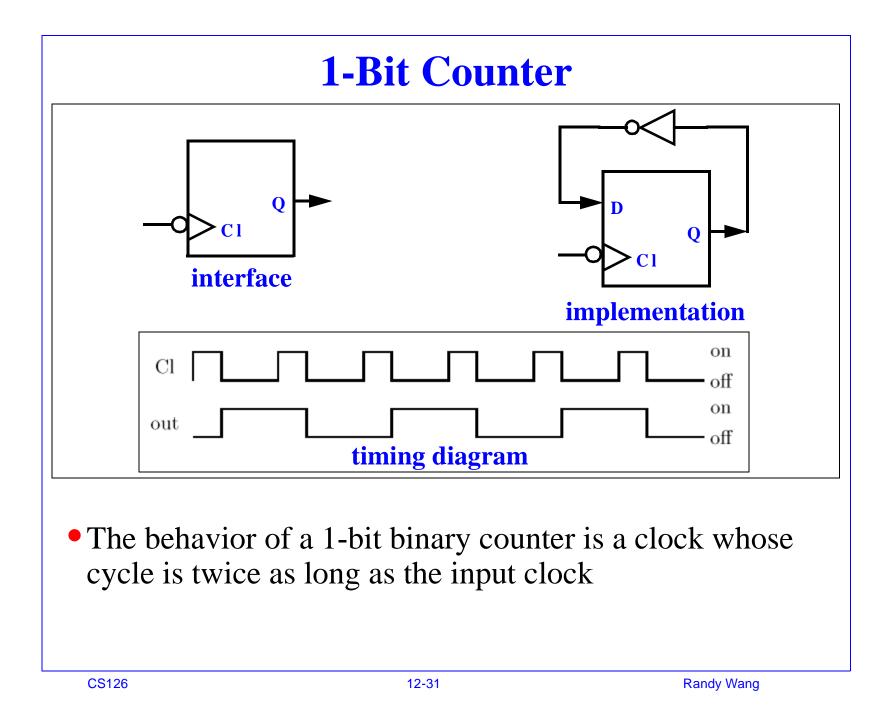

- Memory vs. register files
  - Lecture notes use the term "memory"
  - Meant to say register files (or SRAM)
  - DRAM made differently--no flip-flops
  - DRAM: one transistor per bit!
  - Much higher density than flip-flops, but slower

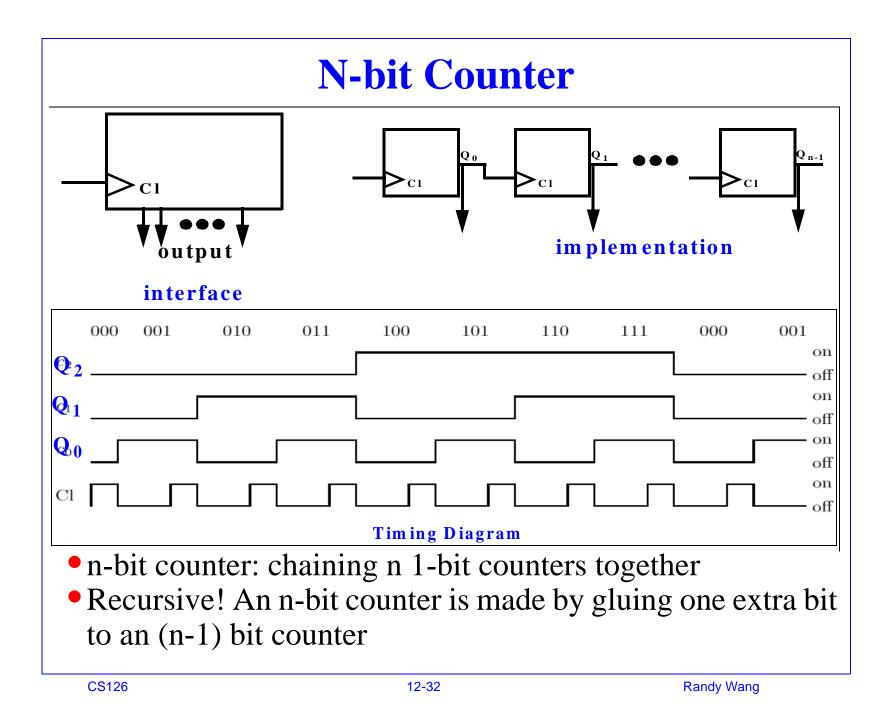

• Must use multiplexer (or its equivalent: [3-state logic])

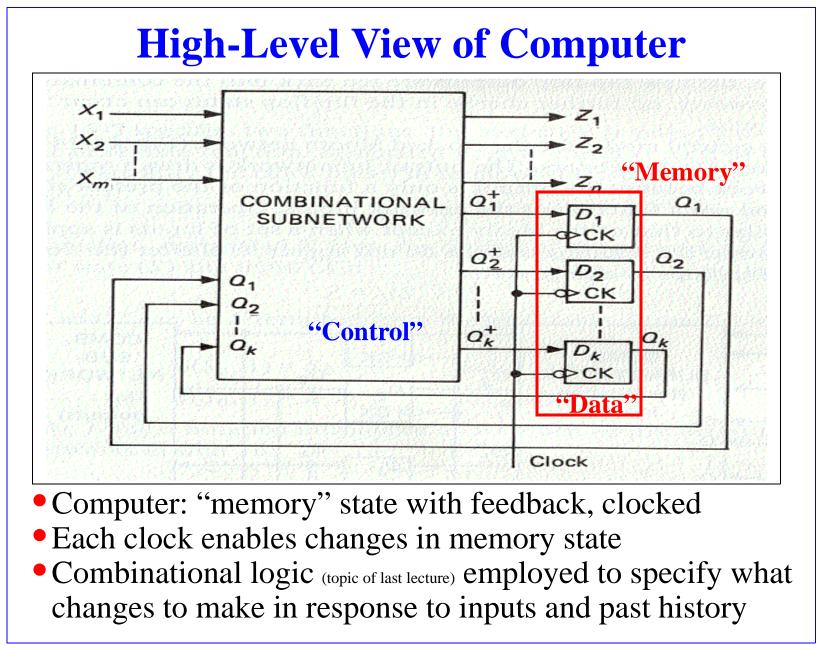

- Introduction
- An S-R Flip-flop
- More flip-flops
- Registers and register files
- <u>Counters</u>
- Conclusions

- Introduction
- An S-R Flip-flop
- More flip-flops
- Registers and register files
- Counters
- <u>Conclusions</u>

### What We Have Learned Today

- Flip-flops ([S-R, D], [unclocked, clocked, master-slave, edge triggered])
  - Their behavior (timing diagrams, truth tables, characteristic equations)
  - How they are made
- Some sequential devices (registers, register files, counters)
  - Their behavior
  - How they are made
